Vim

WORK EXPERIENCE

CASEWARE

Software Engineering Intern — Toronto, Canada

Java Springboot, AWS, SQL, Python — 09.2020 - 09.2021

- Improved the throughput of data streams of a large database between the client and server.
- Provided an accessible data transfer object which was cross-compatible with a variety of microservices using APIs and AWS.
- Architected and modified SQL relational databases to optimize for the company's workflow.
- Developed a slack webhook for sending messages to the corresponding people when GitHub updates occurred.

PROJECTS

Signal Processing Educational Tool — 9.2021 - Present

C++, QT

- Developing an educational tool to teach students signal processing concepts through audio and visual feedback from synthesized waves.
- Created the method for playing sounds and audio files in real time.
- Integrated wave generation library to the environment.

Food Detection and Classification AI Model — 3.2020 - 4.2020

Python, PyTorch

- Produced a machine-learning algorithm that classifies pictures of food with the use of transfer learning of various convolutional neural networks.
- Revamped the algorithm to a region-based convolutional neural network so that our model can detect multiple foods in an image.
- Achieved an accuracy of 70%.

Basic Geographic Information System — 1.2019 - 4.2019

C++

- Planned and created a multi-city map application with the OpenStreetMap API and the EZGL graphical interface library.
- Implemented Dijkstra's algorithm and optimized it using A* heuristics and applied it to improve the traveling salesman problem.
- Refined the salesman problem with multithreading.

Basic Platformer Game — 3.2019 - 4.2019

FPGA, C

- Developed a basic outline of a platformer game with a partner with the use of the Intel software program, the Monitor Program, and an ARM processor chip, DE1-SoC.
- The game is compatible with the keyboard and flexible for further implementation.
- Added physics such as gravity and collision detection.
